

Video Transcription Pipeline

Code: `backend/src/services/videoTranscriptionService.js`

Called from: `backend/src/services/grievanceService.js`, immediately before `analyzeContent()`

Flow

Details: up to 3 clips per post; a failed transcription returns nothing and the post is analysed on its caption alone.

Language handling

The ASR model is called with **no language hint**, so it auto-detects and returns the transcript in its own script — Devanagari for Hindi and Chhattisgarhi, Latin for English.

Once the transcript is merged into the post text, the combined string goes through language detection:

Translation happens **once**, on the whole merged string, before any model reads it — rather than asking each stage to translate and reason in the same pass, which was observed to invert meaning on regional-language text.

Limits

Limit	Value
Clips per post	3
Max file size	200 MB
Download timeout	120 s
Audio chunk length	25 s
Audio format	16 kHz mono WAV
